Standard Specification for Stainless Steel Socket, Square Head, and Slotted Headless-Set Screws

This standard is issued under the fixed designation F880; the number immediately following the designation indicates the year of original adoption or, in the case of revision, the year of last revision. A number in parentheses indicates the year of last reapproval. A superscript epsilon (ε) indicates an editorial change since the last revision or reapproval.

This standard has been approved for use by agencies of the Department of Defense.

1. Scope

1.1 This specification covers the requirements for austenitic grade stainless steel socket-set screws (SSS) sizes 0.060 through 1.000 in. square head set screws (SHSS) sizes 0.190 through 1.500 in., and slotted headless set screws (HSS) 0.060 through 0.750 in., in two conditions, AF and CW.

1.2 Units—The values stated in inch-pound units are to be regarded as standard. No other units of measurement are included in this standard.

NOTE 1—A complete metric companion to Specification F880 has been developed—F880M; therefore, no metric equivalents are shown in this specification.

1.3 The following hazards caveat pertains only to Test Method Section, Section 12 of this specification. This standard does not purport to address (all of) the safety problems associated with its use. It is the responsibility of the user of this standard to establish appropriate safety and health practices and determine the applicability of regulatory limitations prior to use.

2. Referenced Documents

2.1 ASTM Standards:

A262 Practices for Detecting Susceptibility to Intergranular Attack in Austenitic Stainless Steels
A342/A342M Test Methods for Permeability of Feebly Magnetic Materials
A380 Practice for Cleaning, Descaling, and Passivation of Stainless Steel Parts, Equipment, and Systems
A555/A555M Specification for General Requirements for Stainless Steel Wire and Wire Rods
A751 Test Methods, Practices, and Terminology for Chemical Analysis of Steel Products
A967 Specification for Chemical Passivation Treatments for Stainless Steel Parts
D3951 Practice for Commercial Packaging
E18 Test Methods for Rockwell Hardness of Metallic Materials
F593 Specification for Stainless Steel Bolts, Hex Cap Screws, and Studs
F788/F788M Specification for Surface Discontinuities of Bolts, Screws, and Studs, Inch and Metric Series
F1470 Practice for Fastener Sampling for Specified Mechanical Properties and Performance Inspection

2.2 ASME Standard:

B 18.3 Socket Cap, Shoulder and Set Screws, Inch Series
B 18.6.2 Slotted Head Cap Screws, Square Head Set Screws, and Slotted Headless Set Screws (Inch Series)

3. Classification

3.1 The designation of the alloy group and condition for the two materials and conditions of this specification shall be consistent with the stainless steel designations in Specification F593.

3.2 The austenitic stainless steel socket set screw shall be designated F880 Group I Condition AF (solution annealed) or F880 Group I Condition CW (cold worked).

4. Ordering Information

4.1 Orders for material under this specification shall include the following information:

4.1.1 Quantity (number of screws);
4.1.2 Dimensions, including nominal thread designation, thread pitch, nominal screw length (inches) and point configuration. A standard part number may be used for this definition;
4.1.3 Name of the screw (SSS, SHSS or HSS);
4.1.4 Condition AF/CW;

A Summary of Changes section appears at the end of this standard

Copyright © ASTM International, 100 Barr Harbor Drive, PO Box C700, West Conshohocken, PA 19428-2959. United States

Copyright by ASTM Int'l (all rights reserved);
4.1.5 Surface finish, if required. If a finish other than passivation is required, it must be specified on the order or product standard;
4.1.6 ASTM specification and year of issue; and
4.1.8 If torque testing is required for socket set screws sizes over 1/2 inch.

4.2 Example—50 000 pieces 0.250-20 x 0.375 cone point SSS CW ASTM F880 – XX.

5. Materials and Manufacture

5.1 The screw may be forged, formed, extruded, machined, or ground to meet the dimensional characteristics and performance requirements.

5.2 Heat Treatment—Austenitic alloys Group 1 Condition AF screw shall be annealed by heating to 1900 ± 50°F to obtain maximum corrosion resistance and minimum permeability. The screws shall be held for a sufficient time at temperature, then cooled at a rate sufficient to prevent precipitation of the carbide and provide the properties in accordance with Table 1.

5.3 When condition CW is specified, the austenitic alloys shall be annealed as specified in 5.2, generally by the raw material manufacturer, and then cold worked to develop specific properties.

6. Chemical Composition

6.1 The analysis of the screw material shall conform to the chemical composition specified in Table 2.

6.2 Unless otherwise specified in the inquiry and purchase order (see Supplementary Requirement S2), the choice of alloy used shall be that of the fastener manufacturer as determined by his fabrication methods and material availability. The specific alloy used by the manufacturer shall be clearly identified on all certification required in the purchase order and shall have a chemical composition conforming to the limits specified in Table 2.

6.3 When chemical analysis is performed by the purchaser using finished fasteners representing each lot, the chemical contents obtained shall conform to the limits specified in Table 2 for the specific alloy. Chemical composition shall conform to the tolerances specified in Specification A555/A555M.

6.3.1 In the event of a discrepancy, a referee analysis of the samples for each lot as specified in 12.1 shall be made in accordance with 11.3.1.

7. Mechanical Properties

7.1 Socket-set screws, when subjected to a torque test in accordance with 12.3.1, shall withstand application of the test tightening torque specified in Table 1 without evidence of the socket reaming or the screw bursting. Socket set screws in sizes in nominal diameters over 1/2 in. are not subject to torques testing unless required by purchaser. The test torque values must be supplied by purchaser and agreed to by the supplier.

7.2 The hardness limits from 70 to 95 HRB (125 to 210 DPH) for Condition AF and 96 HRB to 33 HRC (216 to 327 DPH) for Condition CW shall be met as determined using Test Methods E18.

8. Corrosion Resistance Requirements

8.1 Carbide Precipitation:

8.1.1 Rod, bar, and wire in the austenitic alloy groups 1, 2, and 3, except the free-machining grades, 303 and 303Se, used to make fasteners in accordance with this specification shall be capable of passing the test for susceptibility to intergranular corrosion as specified in Practice E of Practices A262.

8.1.2 As stated in Practices A262, samples may be subjected to the faster and more severe screening test in accordance with Table 1, Socket Set Screw Torsional Strength Requirements.

### Table 1: Socket Set Screw Torsional Strength Requirements

*For socket set screw sizes over 1/2 inch, torsional strength testing is not required unless specified by purchaser. The test torque values must be supplied by purchaser and agreed upon by the supplier.
Practice A. Failing Practice A, specimens shall be tested to Practice E and be considered satisfactory if passing Practice E.

9. Dimensions

9.1 Unless otherwise specified, the product shall conform to the requirements of ASME B 18.3 or B 18.6.2 as applicable.

10. Workmanship, Finish, and Appearance

10.1 Surface Treatment—Unless otherwise specified, screws shall be cleaned, descaled, and passivated in accordance with Practice A380 or Specification A967 at the option of the manufacturer.

10.2 Surface Discontinuities:

10.2.1 The surface discontinuities for these products shall conform to Specification F788/F788M and the additional limitations specified herein.

10.2.1.1 Processing cracks that connect the socket to the periphery of the screw are not permissible. Defects originating on the periphery with a traverse indicating a potential to intersect are not permissible. For peripheral discontinuities, the maximum depth may be 0.06 $D$.

11. Number of Tests

11.1 The requirements of this specification shall be met in continuous mass production for stock and the manufacturer shall make sample inspections to ensure that the product conforms to the specified requirements. Additional tests of individual shipments of fasteners are not ordinarily necessary. A record of the individual heat of steel in each lot shall be maintained. The containers shall be coded to permit identification of the lot.

11.2 When specified in the purchase order, the manufacturer shall furnish a test report of the last complete set of chemical analysis and mechanical tests for each stock size in each shipment.

11.3 When tests of individual shipments are required, Supplementary Requirement S1 must be specified in the inquiry and order.

11.3.1 When the purchaser does not specify the sampling plan and basis of acceptance, the following shall apply.

11.3.1.1 The lot, for purposes of selecting samples, shall consist of all products offered for inspection and testing at one time, that are of the same style, nominal diameter, thread pitch, nominal length, material type, and condition, and surface finish.

11.3.1.2 From each lot, samples shall be selected at random and tested for each requirement in accordance with the following:

Number of Pieces in Lot | Number of Samples
--- | ---
800 and less | 1
Over 800 to 8000, incl | 2
Over 8000 to 22 000, incl | 3
Over 22 000 | 5

11.3.1.3 Should any sample fail to meet the requirements of a specified test, double the number of samples from the same lot shall be retested for the requirement(s) in which it failed. All of the additional samples shall conform to the specification or the lot shall be rejected.

11.3.1.4 If the failure of a test specimen is due to improper preparation of the specimen or an incorrect testing technique, the specimen shall be discarded and another test specimen submitted.

11.4 Corrosion Resistance Tests:

11.4.1 Unless otherwise specified, inspection for corrosion resistance shall be in accordance with the manufacturer’s standard quality control practices. No specific method of inspection is required but the screws shall be produced from suitable raw material and manufactured by properly controlled practices to maintain resistance to corrosion. When corrosion tests are required, Supplementary Requirement S4 must be specified in the inquiry and order except as noted in 11.4.2.

11.4.2 Products that have been hot worked shall be solution annealed and tested to determine freedom from precipitated carbides. Not less than one corrosion test shall be made from each lot. Corrosion tests shall be performed in accordance with Practices A262, Practices A or E as applicable.
12. Test Methods

12.1 Chemical Analysis—The chemical composition shall be determined in accordance with Test Methods, Practices, and Terminology A751.

12.2 The fastener manufacturer may accept the chemical analysis of each heat of raw material purchased and reported on the raw material certification furnished by the raw material producer. The fastener manufacturer is not required to do any further chemical analysis testing, provided that precise heat lot traceability has been maintained throughout the manufacturing process on each lot of fasteners produced and delivered.

12.3 Mechanical Tests:

12.3.1 For socket strength torque test, the test screw shall be assembled into a tapped hole of 5H tolerance class in a steel block (Fig. 1) until the face of the screw is flush with the top surface of the test block and the set screw bears against a firm base, such as a hardened screw installed from the opposite side of the block. The applicable hexagon key bit, in accordance with ASME B 18.3, shall be inserted to the full depth of the set screw socket and the test torque listed in Table 1 applied by means of a torque wrench. The screw shall be disassembled from the block and examined for compliance to the requirements of 6.1.

12.4 Corrosion Resistance—When specified on the purchase order or inquiry, corrosion tests to determine freedom from precipitated carbides shall be performed in accordance with Practices A262, Practice A or E as applicable.

13. Inspection

13.1 If the inspection described in 13.2 is required by the purchaser, it shall be specified in the inquiry, order, or contract.

13.2 The inspector representing the purchaser shall have free entry to all parts of the manufacturer’s works that concern the manufacture of the material ordered. The manufacturer shall afford the inspector all reasonable facilities to satisfy that the material is being furnished in accordance with this specification. All tests and inspection required by the specification that are requested by the purchaser’s representative and purchase order shall be made prior to shipment and shall be so conducted as not to interfere unnecessarily with the operation of the work.

14. Rejection and Rehearing

14.1 Screws that fail to conform to the requirements of this specification may be rejected by the purchaser. Rejection shall be reported to the supplier promptly and in writing. In case of dissatisfaction with the results of tests or inspection authorized by the purchaser, the supplier may make claim for a rehearing.

15. Certification

15.1 Test Report—The manufacturer shall maintain on file for a period of 5 years, the original test report, including a copy of the certified chemical analysis of the heat of material used and the results of the required testing for the lot of fasteners.

15.2 Manufacturer’s Certificate of Conformance—The manufacturer shall maintain on file for a period of 5 years, a certificate indicating that the lot of fasteners was manufactured and tested in accordance with this specification and conforms to all specified requirements.

15.3 When requested by the purchaser, submission of copies of the test report, manufacturer’s certificate or an extension of the 5 year document retention period shall be performed as agreed between the manufacturer and the purchaser at the time of the inquiry or order.

16. Packaging and Package Marking

16.1 Packaging:

16.1.1 The manufacturer shall employ such methods of packaging the screws as may be reasonably required to ensure their receipt by the purchaser in a satisfactory condition. Unless otherwise specified packaging shall be in accordance with Practice D3951.

16.1.2 When special packaging requirements are required by the purchaser, they shall be defined at the time of inquiry and order.

16.2 Package Marking—Each shipping unit shall include or be plainly marked with the following:

16.2.1 ASTM specification,
16.2.2 Alloy condition,
16.2.3 Alloy number,
16.2.4 Size,
16.2.5 Name and brand or trademark of the manufacturer,
16.2.6 Country of origin,
16.2.7 Number of pieces, and
16.2.8 Purchase order number.
SUPPLEMENTARY REQUIREMENTS

One or more of the following supplementary requirements shall apply only when specified by the purchaser in the inquiry and order (see 4.1.7). Supplementary requirements shall in no way negate any requirement of the specification itself.

S1. Shipment Lot Testing
   S1.1 When Supplementary Requirement S1 is specified on the order, the manufacturer shall make sample tests on the individual lots for shipment to ensure that the product conforms to the specified requirements.
   S1.2 The manufacturer shall make an analysis of a randomly selected finished fastener from each lot of product to be shipped. Heat or lot control shall be maintained. The analysis of the starting material from which the fasteners have been manufactured may be reported in place of the product analysis.
   S1.3 The manufacturer shall perform mechanical property tests in accordance with this specification and Guide F1470 on the individual lots for shipment.
   S1.4 The manufacturer shall furnish a test report for each lot in the shipment showing the actual results of the chemical analysis and mechanical property tests performed in accordance with Supplementary Requirement S1.

S2. Alloy Control
   S2.1 When Supplementary Requirement S2 is specified on the inquiry and order, the manufacturer shall supply that stainless steel specified on the customer’s order with no group substitutions permitted without written permission by the purchaser.

S3. Permeability
   S3.1 When Supplementary Requirement S3 is specified on the inquiry and order, the permeability of screws of Condition AF shall not exceed 1.05 at 100 Oe when determined by Test Methods A342/A342M. Screws in Condition CW may not be capable of meeting permeability and hardness requirements simultaneously.

S4. Corrosion Resistance Tests
   S4.1 When Supplementary Requirement S4 is specified on the inquiry and order, corrosion test(s) shall be performed as agreed between the manufacturer and the purchaser at the time of the inquiry or order.

S5. Passivation
   S5.1 When Supplementary Requirement S5 is specified on the inquiry and order, the finished product shall be passivated in accordance with Specification A380.

S6. Alloy 316 Control
   S6.1 When Supplementary Requirement S6 is specified Carbon shall not be less than 0.03. Alloy 316L shall not be substituted for Alloy 316 due to its unacceptability in elevated temperatures.

S7. Prohibition of Free Machining CRES Alloys 303 and 303Se
   S7.1 When S7 is invoked, Free Machining CRES Alloys 303 and 303Se shall not be supplied, due to their unsuitability in preventing corrosion when occasionally wetted by seawater or in a salt environment.

SUMMARY OF CHANGES

Committee F16 has identified the location of selected changes to this standard since the last issue (F880—02(Reapproved 2008)) that may impact the use of this standard.

(1) Added square head and slotted headless drives; revised scope to incorporate proposed revisions; added reference to B 18.6.2; revised sections 4.1.3, 4.1.8, 9.1, Table 2 and Table 1, and added Supplementary Requirements S6 and S7.
