Standard Specification for
Alloy Steel Socket Button and Flat Countersunk Head Cap Screws¹

This standard is issued under the fixed designation F835; the number immediately following the designation indicates the year of original adoption or, in the case of revision, the year of last revision. A number in parentheses indicates the year of last reapproval. A superscript epsilon (ε) indicates an editorial change since the last revision or reapproval.

This standard has been approved for use by agencies of the Department of Defense.

1. Scope*

1.1 This specification covers the requirements for quenched and tempered alloy steel hexagon socket button (SBHCS) 0.060 through 0.625 thread sizes and flat countersunk (SFHCS) 0.060 through 1.5 thread sizes head cap screws having material properties for high-strength requirements.

1.2 Fasteners meeting this specification are intended for shear-type applications and have tensile requirements ranging from 122 to 150 ksi.

1.3 The values stated in inch-pound units are to be regarded as standard. No other units of measurement are included in this standard.

1.4 The hazard statement applies only to the test method section, Section 11, of this specification. This standard does not purport to address all of the safety concerns, if any, associated with its use. It is the responsibility of the user of this standard to establish appropriate safety and health practices and determine the applicability of regulatory limitations prior to use.

2. Referenced Documents

2.1 ASTM Standards:

A751 Test Methods, Practices, and Terminology for Chemical Analysis of Steel Products
D3951 Practice for Commercial Packaging
E3 Guide for Preparation of Metallographic Specimens
E18 Test Methods for Rockwell Hardness of Metallic Materials
E112 Test Methods for Determining Average Grain Size
E384 Test Method for Knoop and Vickers Hardness of Materials
F606M Test Methods for Determining the Mechanical Properties of Externally and Internally Threaded Fasteners, Washers, and Rivets (Metric)
F788/F788M Specification for Surface Discontinuities of Bolts, Screws, and Studs, Inch and Metric Series

2.2 ASME Standards:

B18.3 Socket Cap, Shoulder and Set Screws—Inch Series
B18.24 Part Identifying Number (PIN) Code System Standard for B18 Fastener Products
B18.24 Part Identifying Number (PIN) Code System Standard for B18 Fastener Products

3. Ordering Information

3.1 Orders for material under this specification shall include the following:

3.1.1 Quantity (number of screws).

3.1.2 Dimensions, including nominal thread designation, thread pitch, and nominal screw length (inches). A standard part number may be used for this definition.

3.1.3 Name of the screw: SBHCS or SFHCS.

3.1.4 Coating, if required. If a protective finish other than black oxide is required, it must be specified on the order or product standard.

3.1.5 Lot testing, if required (see 10.3).

3.1.6 Certification, if required (see 14.1).

3.1.7 ASTM designation and year of issue.

3.1.8 Any special requirements.

3.1.9 For establishment of a part identifying system, see ASME B18.24.

3.2 Example—1000 pieces 0.250 − 20 × 0.375 SBHCS lot tensile test. ASTM F835–XX.

4. Materials and Manufacture

4.1 The screws shall be fabricated from alloy steel made to fine grain practice. In the event of controversy over grain size, referee tests on finished screws conducted in accordance with Test Methods E112 shall prevail.

4.2 Screws shall be hot or cold upset or extruded, or both.

¹This specification is under the jurisdiction of ASTM Committee F16 on Fasteners and is the direct responsibility of Subcommittee F16.02 on Steel Bolts, Nuts, Rivets and Washers.

²For referenced ASTM standards, visit the ASTM website, www.astm.org, or contact ASTM Customer Service at service@astm.org. For Annual Book of ASTM Standards volume information, refer to the standard’s Document Summary page on the ASTM website.

Get a Summary of Changes section appears at the end of this standard
4.3 Unless otherwise specified, threads shall be rolled for diameters through 0.625 in. and for screw lengths through 4 in. For diameters and lengths other than this, threads may be rolled, cut or ground.

4.4 Screws shall be heat treated by quenching in oil from above the transformation temperature and then tempering by reheating to at least 650°F to be within the hardness range specified in Table 1.

4.4.1 The minimum tempering temperature may be verified by submitting screws to 635°F for 30 min at temperature. The average cross-section hardness of three readings on the screw before and after retempering shall not differ by more than 20 DPH.

4.5 When protective or decorative coatings are applied to the screws, precautions as required by the coatings shall be taken to prevent embrittlement.

5. Chemical Composition

5.1 The chemical composition of the screw material shall conform to the heat analysis specified in Table 2.

5.2 One or more of the following alloying elements, chromium, nickel, molybdenum, or vanadium, shall be present in the steel in sufficient quantity to ensure the specific strength properties are met after oil quenching and tempering. The steel shall meet the AISI definition of alloy steel, that is, maximum and minimum element content requirement or minimum element limits specified.

5.3 Steel to which bismuth, selenium, tellurium, or lead has been added intentionally shall not be permitted.

5.4 Material analysis may be made by the purchaser from finished products and the chemical composition thus determined shall conform to the requirements specified for the product analysis in Table 2.

6. Mechanical Properties

6.1 The finished screws shall conform to the mechanical requirements specified in Table 1.

6.2 Screws having a nominal length equal to or greater than 3 diameters shall be tested full size and shall conform to the full-size tensile requirements specified in Table 3. Tensile failures through the head are acceptable provided the load requirements are satisfied.

6.3 Screws having a nominal thread diameter-length combination as specified in 6.2 and a breaking load exceeding 200 000 lb preferably shall be tested full size and shall meet the full-size tensile properties in Table 3. When equipment of sufficient capacity for such tests is not available or if excessive length of the screws makes full-size testing impractical, standard round machined specimens may be used that shall meet the machined test specimen tensile properties in Table 1. If discrepancy between full-size and machined specimen results, full-size tests shall be used as the referee method to determine acceptance.

6.4 Screws that are too short (lengths less than three times nominal size) or that have insufficient threads for tension testing shall not be subject to tension tests but shall conform to the hardness (minimum and maximum) requirements of Table 1.

6.5 All screws, regardless of size, shall conform to the hardness specified in Table 1. Hardness shall be met anywhere on the cross section through the threaded portion one diameter from the screw point.

7. Other Requirements

7.1 Decarburization:

7.1.1 There shall be no evidence of carburization or gross decarburization on the surfaces of the heat-treated screws when measured in accordance with 11.5.

7.1.2 The depth of partial decarburization shall be limited to the values in Table 4 when measured as shown in Fig. 1, and in accordance with 11.5.

7.2 Brittle—Coated screws shall withstand the embrittlement test in accordance with 11.4 without showing indications of discontinuities. The loading shall be calculated with minimum screw tensile requirements.

8. Dimensions

8.1 Unless otherwise specified, the dimensions shall conform to the requirements of ASME B 18.3.

9. Workmanship, Finish, and Appearance

9.1 Surface Finish—The screws shall have a black (thermal or chemical) oxide finish, unless otherwise specified.

9.2 Surface Discontinuities:

9.2.1 The surface discontinuities for these products shall conform to Specification F788/F788M and the additional limitations specified herein.
9.2.2 Forging defects that connect the socket to the periphery of the head are not permissible. Defects originating on the periphery and with a traverse indicating a potential to intersect are not permissible. Other forging defects are permissible, provided those located in the bearing area, fillet and top surfaces shall not have a depth exceeding 0.03 $D$ or 0.005 in., whichever is greater. For peripheral discontinuities, the maximum depth may be 0.06 $D$ not to exceed 0.040 in. (see Fig. 2).

9.2.3 Forging defects located in the socket wall within 0.1 times the actual key engagement, $T$, from the bottom of the socket are not permissible. Discontinuities located elsewhere in the socket shall not have a length exceeding 0.25 $T$ or a maximum depth of 0.03 $D$ not to exceed 0.005 in. (see Fig. 3).

9.2.4 Seams in the shank shall not exceed a depth of 0.03 $D$ or 0.008 in., whichever is greater.

9.2.5 No transverse discontinuities shall be permitted in the head-to-shank fillet area.

9.2.6 Threads shall have no laps at the root or on the flanks, as shown in Fig. 4. Laps are permitted at the crest (Fig. 4c) that do not exceed 25 % of the basic thread depth and on the flanks outside the pitch cylinder. Longitudinal seams rolled beneath the root of the thread and across the crests of cut threads are acceptable within the limits of 9.2.4.

9.2.7 Quench cracks of any depth, any length, or in any location are not permitted.

10. Number of Tests

10.1 The requirements of this specification shall be met in continuous mass production for stock, and the manufacturer shall make sample inspections to ensure that the product conforms to the specified requirements. Additional tests of individual shipments of material are not ordinarily contemplated. A record of individual heats of steel in each test lot shall be maintained. The container shall be coded to permit identification of the lot.

10.2 When specified in the order, the manufacturer shall furnish a test report certified to be the last complete set of mechanical tests for each stock size in each shipment.

10.3 When additional tests are specified on the purchase order, a lot, for purposes of selecting test samples, shall consist
of all screws offered for inspection at one time of one diameter and length. From each lot, the number of samples for each requirement shall be as follows:

<table>
<thead>
<tr>
<th>Number of Pieces in Lot</th>
<th>Number of Samples</th>
</tr>
</thead>
<tbody>
<tr>
<td>800 and less</td>
<td>1</td>
</tr>
<tr>
<td>Over 800 to 8000, incl</td>
<td>2</td>
</tr>
<tr>
<td>Over 8000 to 22 000, incl</td>
<td>3</td>
</tr>
<tr>
<td>Over 22 000</td>
<td>5</td>
</tr>
</tbody>
</table>

10.4 Should any sample fail to meet the requirements of a specified test, double the number of samples from the same lot shall be retested for the requirement(s) in which it failed. All of the additional samples shall conform to the specification or the lot shall be rejected.

11. Test Methods

11.1 Chemical analysis shall be conducted in accordance with Test Methods, Practices, and Terminology A751.

11.2 Tensile properties shall be determined in accordance with Test Methods F606M.

11.3 Hardness shall be determined in accordance with Test Methods E18.

11.4 Embrittlement tests shall be conducted in accordance with Test Methods F606M. The countersunk washer for the flat countersunk head cap screw shall be placed with the axis of the conical recess at the required wedge angle with the fastener axial load.

11.5 Decarburization and carburization tests shall be conducted as follows:

11.5.1 Section the thread area of the bolt longitudinally through the axis, mount, and polish it in accordance with Practice E3. Take measurements (1) at the minor diameter in the center of the thread ridge, and (2) 0.75 h toward the thread crest on the perpendicular bisector of the thread ridge. Take a measurement (3) on the thread flank approximately at the pitch line at a depth of 0.003 in. Use one of the two methods for
carburization/decarburization evaluation either optical or microhardness measurements. The microhardness measurement shall constitute a referee method in case of dispute.

11.5.2 For optical measurement, etch the section in 2 to 4 % nital. Examine the surface of the etched samples under a microscope at 100x using a measuring eyepiece graduated in 0.001-in. increments. The width of any light etching band normally defines the decarburization depth. A dark etching band indicates the possibility of carburization.

11.5.3 Measure microhardness in accordance with Test Method E384 on unetched specimens using a DPH 136° indenter or a Knoop indenter using the following load application:

<table>
<thead>
<tr>
<th>Number of Threads per Inch</th>
<th>Load</th>
</tr>
</thead>
<tbody>
<tr>
<td>Less than 40</td>
<td>500 gf</td>
</tr>
<tr>
<td>40, 44, and 48</td>
<td>200 gf</td>
</tr>
<tr>
<td>Over 48</td>
<td>Use optical evaluation in 11.5.2.</td>
</tr>
</tbody>
</table>

11.5.3.1 Take measurements at the minor diameter (Reading Number 1) on the thread crest bisector to determine base metal hardness. Take measurements (Reading Number 2) on the bisector 0.75 h from the minor measurement toward the crest. Also take measurements (Reading Number 3) on the thread flank at the pitch line at a depth within 0.003 from the surface. Reading Number 3 may be taken on the same or an adjacent thread.

11.5.4 Interpret microhardness readings as follows:

11.5.4.1 A decrease of more than 30 hardness points from Reading Number 1 to Reading Number 2 shall be regarded as decarburization and indicates the screw does not conform to specification requirements.

11.5.4.2 An increase of more than 30 hardness points from Reading Number 1 to Reading Number 3 shall be regarded as carburization and indicates that the screw does not conform to specification requirements.

12. Inspection

12.1 The inspector representing the purchaser, upon reasonable notice, shall have free entry to all parts of the manufacturer’s works that concern the manufacture of the material ordered. The manufacturer shall afford the inspector all reasonable facilities to satisfy him that the material is being furnished in accordance with this specification. All tests and inspections required by the specification that are requested by the purchaser’s representative shall be made before shipment and shall be so conducted as not to interfere unnecessarily with the operation of the works.

13. Rejection and Rehearing

13.1 Material that fails to conform to the requirements of this specification may be rejected. Rejection should be reported to the producer or supplier promptly and in writing. In case of dissatisfaction with the results of the test, the producer or supplier may make claim for a rehearing.

14. Certification

14.1 Upon request of the purchaser in the contract or order, a manufacturer’s certification that the material was manufactured and tested in accordance with this specification together with a report of the latest mechanical tests of each stock size in each shipment shall be furnished at the time of shipment.

15. Responsibility

15.1 The party responsible for the fastener shall be the organization that supplies the fastener to the purchaser.

16. Packaging and Package Marking

16.1 Packaging:

16.1.1 Unless otherwise specified, the packaging shall be in accordance with Practice D3951.

16.1.2 When special packaging requirements are required, they shall be defined at the time of the inquiry and order.
16.2 Package Marking:
16.2.1 Each shipping unit shall include or be plainly marked with the following information:
16.2.1.1 ASTM designation,
16.2.1.2 Brand name or trademark of the manufacturer,
16.2.1.3 Number of pieces,
16.2.1.4 Purchase order number, and
16.2.1.5 Country of origin.

17. Keywords
17.1 alloy steel; cap screws; socket button head; socket flat countersunk head; steel

SUMMARY OF CHANGES

Committee F16 has identified the location of selected changes to this standard since the last issue, F835 – 04ε1, that may impact the use of this standard.

(I) Revised Table 3, to accurately reference the full-size minimum tensile strength requirements of Table 1.
