Standard Specification for Precipitation-Hardening Bolting (UNS N07718) for High Temperature Service

This standard is issued under the fixed designation A1014/A1014M; the number immediately following the designation indicates the year of original adoption or, in the case of revision, the year of last revision. A number in parentheses indicates the year of last reapproval. A superscript epsilon (ε) indicates an editorial change since the last revision or reapproval.

1. Scope*

1.1 This specification covers precipitation hardening bolting (UNS N07718) for high temperature service. See Specification A962/A962M for the definition of “bolting.”

1.2 The following referenced general requirements are indispensible for application of this specification: Specification A962/A962M.

1.3 Supplementary requirements are provided for use at the option of the purchaser. The supplementary requirements only apply when specified individually in the purchase order or contract.

1.4 This specification is expressed in both inch-pound and in SI units. However, unless the purchase order or contract specifies the applicable M designation (SI units), the inch-pound units shall apply.

1.5 The values stated in either SI units or inch-pound units are to be regarded separately as standard. Within the text, the SI units are shown in brackets. The values stated in each system may not be exact equivalents; therefore, each system shall be used independently of the other. Combining values from the two systems may result in non-conformance with the standard.

2.1 ASTM Standards:2

A370 Test Methods and Definitions for Mechanical Testing of Steel Products
A962/A962M Specification for Common Requirements for Bolting Intended for Use at Any Temperature from Cryogenic to the Creep Range

B637 Specification for Precipitation-Hardening and Cold Worked Nickel Alloy Bars, Forgings, and Forging Stock for Moderate or High Temperature Service
B880 Specification for General Requirements for Chemical Check Analysis Limits for Nickel, Nickel Alloys and Cobalt Alloys
E112 Test Methods for Determining Average Grain Size
E292 Test Methods for Conducting Time-for-Rupture Notch Tension Tests of Materials

2.2 ASME Standards:3

B1.1 Screw Threads

2.3 SAE Standards:4

AS 7467 Bolts And Screws, Nickel Alloy, UNS N07718 Tensile Strength 185 KSI [1275 MPa] Stress Rupture Rated Procurement Specification

3. Ordering Information

3.1 Ordering—It shall be the responsibility of the purchaser to specify all requirements that are necessary for product under this specification including any supplementary ones and those included in the ordering information required by Specification A962/A962M.

4. Common Requirements

4.1 Common Requirements—Bolting furnished to this specification shall conform to Specification A962/A962M, including any supplementary requirements indicated on the purchase order. Failure to comply with Specification A962/A962M constitutes non-conformance with this specification. If the requirements of this specification conflict with those of Specification A962/A962M, then the requirements of this specification shall prevail.

5. Manufacture

5.1 Melting Process—Alloy shall be multiple melted using consumable electrode practice in the remelt cycle or shall be induction melted under vacuum. If consumable electrode
remelting is not performed in vacuum, electrodes produced by vacuum induction melting shall be used.

5.2 Heat Treatment:

5.2.1 Solution Treatment—Material shall be solution heat treated at a temperature within the range of 1725 to 1850 °F [940 to 1010 °C], held at the selected temperature for a time commensurate with cross-sectional thickness, and cooled at a rate equivalent to an air cool or faster.

5.2.1.1 Temperature Variation—Solution treating temperatures shall be controlled in the range of ± 25 °F [± 14 °C].

5.2.2 Precipitation Heat Treatment—Material shall be heated to a temperature of 1325 °F [720 °C], held at temperature for eight hours minimum, furnace cooled to 1150 °F [620 °C] at 100 °F [55 °C] per hour, held at temperature for eight hours, and cooled to room temperature. Alternatively, material may be furnace cooled to 1150 °F [620 °C] at any rate provided the time at 1150 °F [620 °C] is adjusted so the total precipitation heat treatment time is 18 hours minimum.

5.2.2.1 Temperature Variation—Precipitation treatment temperatures and cooling rates shall be controlled in the range of ± 15 °F [± 8 °C].

5.3 Straightening—When straightening is necessary it shall be done after solution treating and prior to aging. Straightening after aging is prohibited.

5.4 Threads—Threads shall be formed by rolling in one pass after oxides have been removed from the area to be threaded.

5.5 Dimensions and Tolerances, Bolting—Fully heat treated material shall meet the dimensional requirements of Specification B637 for UNS N07718.

6. Chemical Composition

6.1 Remelt Ingots—The chemical analyses of each remelted ingot shall conform to the requirements for chemical composition prescribed in Table 1.

6.2 Product Analysis—If a product (check) analysis is performed, the material shall conform to the product (check) analysis variations prescribed in Specification B880.

7. Mechanical Properties

7.1 Tensile and Hardness—All testing shall be performed after aging. The test specimens shall meet the requirements of Table 2.

7.2 Stress Rupture—Stress rupture testing shall be conducted in accordance with Table 2 using a combination test bar in accordance with Test Methods E292. Rupture must occur in the smooth section of each test specimen.

7.3 Headed Fasteners—In addition to 7.1 and 7.2, headed fasteners with body length three times the diameter or longer shall be subjected to full size tensile test in accordance with Annex A3 of Test Methods and Definitions A370 and shall conform to the tensile strength shown in Table 2. The minimum full size breaking strength (lbf) [Kn] for individual sizes shall be as follows:

\[ Ts = UTS \times As \]  

where:

- \( Ts \) = tensile strength,
- \( UTS \) = tensile strength specified in Table 2, and
- \( As \) = stress area, square inches [square millimetres], as shown in ASME B11.1 or calculated as follows:

\[ As = 0.785 \left( D - \left( 0.974/n \right) \right)^2 \]  

where:

- \( D \) = nominal thread size, and
- \( n \) = the number of threads per inch.

\[ [As = 0.785(D - 0.9382P)^2] \]  

where:

- \( D \) = Nominal thread size, and
- \( P \) = Thread pitch, mm.

8. Metallography

8.1 Microstructure—The microstructure shall be free of freckles, white spots, and Laves phases. Threads may show evidence of cold working as a result of rolling. The average grain size shall be determined in accordance with Test Methods E112 and found to be ASTM No 5 or finer. Up to 20 % of the structure may have a grain size as large as a No. 3 due to the presence of noncrystallized grains.

8.2 Macrostructure—Fasteners produced from forgings shall exhibit continuous flow lines in the threads and in any shank to head or fillet and/or bearing surface areas.

9. Number of Tests

9.1 Chemistry—One test per remelt ingot.

9.2 Mechanical Properties—The number of tests shall be in accordance with Specification A962/A962M except that for stress rupture one test shall be run per lot. For headed fasteners with a body length less than three times the diameter a separately forged test bar may be used for tensile and stress rupture testing provided it is heat-treated with the parts. Separately forged bars shall be approximately the same diameter as the headed fastener they represent.

### SUPPLEMENTARY REQUIREMENTS

These requirements do not apply unless specified in the purchase order and in the Ordering Information, in which event the specified tests shall be made before shipment of the product.

**S1. Protective Atmosphere**

S1.1 Heat treatment shall be performed under suitable protective atmosphere.

**S2. Cleaning**

S2.1 Parts shall be cleaned with nitric acid as stated in AS 7467

**S3. Fillet Rolling**

S3.1 The fillet area of the fastener head shall be rolled.

**S4. Forged Heads**

S4.1 Heads shall be forged.

**S5. Marking**

S5.1 Fastener marking shall include heat lot identification.

**S5. Thread Rolling**

S5.1 Thread rolling shall be performed before precipitation heat treatment.

### SUMMARY OF CHANGES

Committee A01 has identified the location of selected changes to this specification since the last issue, A1014/A1014M–09, that may impact the use of this specification. (Approved May 15, 2010)

(1) Revised the title and replaced all instances of “fastener material” with “bolting.”
Committee A01 has identified the location of selected changes to this specification since the last issue, A1014/A1014M–06, that may impact the use of this specification. (Approved May 1, 2009)

(J) Revised title and replaced occurrences of “bolting” with “fastener.” Dropped definition for “bolting material” because it is in Specification A962/A962M. Updated Scope relative to supplementary requirements, use of SI units as per Guide A994, and added reference to Specification A962/A962M as indispensable for application of this specification.

ASTM International takes no position respecting the validity of any patent rights asserted in connection with any item mentioned in this standard. Users of this standard are expressly advised that determination of the validity of any such patent rights, and the risk of infringement of such rights, are entirely their own responsibility.

This standard is subject to revision at any time by the responsible technical committee and must be reviewed every five years and if not revised, either reapproved or withdrawn. Your comments are invited either for revision of this standard or for additional standards and should be addressed to ASTM International Headquarters. Your comments will receive careful consideration at a meeting of the responsible technical committee, which you may attend. If you feel that your comments have not received a fair hearing you should make your views known to the ASTM Committee on Standards, at the address shown below.
