Standard Specification for
Steel, Sheet and Strip, High-Strength, Low-Alloy, Hot-Rolled and Cold-Rolled, with Improved Atmospheric Corrosion Resistance

This standard is issued under the fixed designation A606/A606M; the number immediately following the designation indicates the year of original adoption or, in the case of revision, the year of last revision. A number in parentheses indicates the year of last reapproval. A superscript epsilon (ε) indicates an editorial change since the last revision or reapproval.

This standard has been approved for use by agencies of the Department of Defense.

1. Scope

1.1 This specification covers high-strength, low-alloy, hot- and cold-rolled sheet and strip in cut lengths or coils, intended for use in structural and miscellaneous purposes, where savings in weight or added durability are important. These steels have enhanced atmospheric corrosion resistance and are supplied in two types: Type 2 contains 0.20 % minimum copper based on cast or heat analysis (0.18 % minimum Cu for product check). Type 4 contains additional alloying elements and provides a level of corrosion resistance substantially better than that of carbon steels with or without copper addition (Note 1). When properly exposed to the atmosphere, Type 4 steel can be used bare (unpainted) for many applications.

Note 1—For methods of establishing the atmospheric corrosion resistance of low-alloy steels, see Guide G101.

1.2 The values stated in either SI units or inch-pound units are to be regarded separately as standard. The values stated in each system may not be exact equivalents; therefore, each system shall be used independently of the other. Combining values from the two systems may result in non-conformance with the standard.

2. Referenced Documents

2.1 ASTM Standards:

A109/A109M Specification for Steel, Strip, Carbon (0.25 Maximum Percent), Cold-Rolled
A568/A568M Specification for Steel, Sheet, Carbon, Structural, and High-Strength, Low-Alloy, Hot-Rolled and Cold-Rolled, General Requirements for

A749/A749M Specification for Steel, Strip, Carbon and High-Strength, Low-Alloy, Hot-Rolled, General Requirements for

3. General Requirements for Delivery

3.1 Material furnished under this specification shall conform to the applicable requirements of the current edition of Specification A568/A568M and the dimensional tolerance tables of Specification A109/A109M, unless otherwise provided herein.

4. Ordering Information

4.1 Orders for material under this specification shall include the following information, as required, to describe adequately the desired material:

4.1.1 ASTM specification number and date of issue, and

4.1.2 Name of material (high-strength low-alloy hot-rolled sheet or strip or high-strength low-alloy cold-rolled sheet or strip),

4.1.3 Condition (specify oiled or dry, as required),

4.1.4 Edges (must be specified for hot-rolled sheet or strip) (see 8.1),

4.1.5 Finish—Cold-rolled only (indicate exposed (E) or unexposed (U). Matte (dull) finish will be supplied unless otherwise specified), and

4.1.6 Dimensions (thickness, width, and whether cut lengths or coils).

Note 2—Not all producers are capable of meeting all of the limitations of the thickness tolerance tables in Specification A568/A568M. The purchaser should contact the producer regarding possible limitations prior to placing an order.

4.1.7 Coil size (must include inside diameter, outside diameter, and maximum weight),

4.1.8 Application (show part identification and description),

4.1.9 Cast or heat (formerly ladle) analysis and mechanical properties report (if required) (see 10.1), and

4.1.10 Special requirements (if any).

4.1.10.1 When the purchaser requires thickness tolerances for 3/8 in. [10 mm] minimum edge distance (see Supplementary Requirement in Specification A568/A568M), this requirement shall be specified in the purchase order or contract.

Note 3—A typical ordering description is as follows: “ASTM A606–XX, Type 4 high-strength low-alloy hot-rolled sheet, dry, mill edge 0.106 by 96 in. for truck frame side members.” Or, “ASTM A606M–XX, Type 4 high-strength low-alloy hot-rolled sheet, dry, mill edge, 2.7 by 1220 mm by coil for truck frame side members.”

5. Materials and Manufacture

5.1 Condition—The material shall be furnished hot-rolled or cold-rolled as specified on the purchase order.

5.2 Heat Treatment—Unless otherwise specified, hot-rolled shall be furnished as rolled. When hot-rolled annealed or hot-rolled normalized material is required, it shall be specified on the purchase order.

6. Chemical Composition

6.1 The maximum limits of carbon, manganese, and sulfur shall be as prescribed in Table 1, unless otherwise agreed upon between the manufacturer and the purchaser.

6.2 The manufacturer shall use such alloying elements, combined with the carbon, manganese, and sulfur within the limits prescribed in Table 1 to satisfy the mechanical properties prescribed in Table 2 or Table 3. Such elements shall be included and reported in the specified heat or cast analysis. As indicated in 1.1, these steels have enhanced atmospheric corrosion resistance and are supplied in two types: Type 2 and Type 4. When requested, the producer shall supply acceptable evidence of corrosion resistance to the purchaser. For Type 2 steel, confirmation of the minimum copper content requirement of 1.1 shall be sufficient evidence of corrosion resistance. For Type 4 steel, the basis for this evidence can be a corrosion-resistance index calculated from the chemical composition of the steel in accordance with Guide G101. To comply with Specification A606, Type 4 steel shall have a minimum corrosion-resistance index of 6.0, based upon Guide G101—Predictive Method Based on the Data of Larabee and Coburn (see Note 4.)

Note 4—The user is cautioned that the Guide G101 predictive equation (Predictive Method Based on the Data of Larabee and Coburn) for calculation of an atmospheric corrosion index has been verified only for the composition limits stated in that guide.

7. Mechanical Property Requirements

7.1 Tension Tests:

7.1.1 Requirements—Material as represented by the test specimen shall conform to the tensile requirements specified in Table 2 (hot-rolled material) or in Table 3 (cold-rolled material).

7.1.2 Number of Tests—Two tensile tests shall be made from each heat or from each lot of 50 tons [45 000 kg]. When the amount of finished material from a heat or lot is less than 50 tons [45 000 kg], one test shall be made. When material rolled from one heat differs 0.050 in. [0.27 mm] or more in thickness, one tensile test shall be made from the thickest and thinnest material regardless of the weight represented.

7.1.3 Location and Orientation:

7.1.3.1 Tensile test specimens shall be taken at a point immediately adjacent to the material to be qualified.

7.1.3.2 Tensile test samples shall be taken from the full thickness of the sheet as rolled.

7.1.3.3 Tensile test specimens shall be taken from a location approximately halfway between the center of the sheet and the edge of the material as rolled.

7.1.3.4 Tensile test specimens shall be taken with the axis of the test specimen parallel to the rolling direction (longitudinal test).

7.1.4 Test Method—Yield strength shall be determined by either the 0.2 % offset method or by the 0.5 % extension under load method unless otherwise specified.

7.2 Bending Properties—The minimum forming radius (radius) that steel covered by this specification can be expected to sustain is listed in the Appendix X1 and is discussed in more detail in Specifications A568/A568M and A749/A749M. Where tighter bend radii are required, where curved or offset bends are involved, or where stretching or drawing are also a consideration, the producers should be consulted.
8. Workmanship, Finish, and Appearance

8.1 Edges:

8.1.1 Hot-Rolled—In the as-rolled condition the material has mill edges. Pickled or blast-cleaned material has cut edges. When required, as-rolled material may be specified to have cut edges. If mill edge material is required it must be specified.

8.1.2 Cold-Rolled—Cold-rolled material shall have cut edges only.

8.2 Oiling:

8.2.1 Hot-Rolled—Unless otherwise specified, hot-rolled as-rolled material shall be furnished dry, and hot-rolled pickled or blast-cleaned material shall be furnished oiled. When required, pickled or blast-cleaned material may be specified to be furnished dry, and as-rolled material may be specified to be furnished oiled.

8.2.2 Cold-Rolled—Unless otherwise specified, cold-rolled material shall be oiled. When required, cold-rolled material may be specified to be furnished dry, but is not recommended due to the increased possibility of rusting.

8.3 Surface Finish:

8.3.1 Hot-Rolled—Unless otherwise specified, hot-rolled material shall have an as-rolled, not pickled surface finish. When required, material may be specified to be pickled or blast-cleaned.

8.3.2 Cold-Rolled—Unless otherwise specified, cold-rolled material shall have a matte (dull) finish.

9. Retests and Disposition of Non-Conforming Material

9.1 Retests, conducted in accordance with the requirements of Section 11.1 of Specification A568/A568M, are permitted when an unsatisfactory test result is suspected to be the consequence of the test method procedure.

9.2 Disposition of non-conforming material shall be subject to the requirements of Section 11.2 of Specification A568/A568M.

10. Certification

10.1 When requested, the manufacturer shall furnish copies of a test report showing the results of the heat or cast analysis and mechanical property tests made to determine compliance with this specification. The report shall include the purchase order number, the ASTM designation number, and the heat or lot number correlating the test results with the material represented.

11. Keywords

11.1 alloy steel sheet; alloy steel strip; cold rolled steel sheet; cold rolled steel strip; high strength low alloy steel; hot rolled steel sheet; hot rolled steel strip; steel sheet; steel strip

\(^\d\) Material which does not perform satisfactorily, when fabricated in accordance with the above requirements, may be subject to rejection pending negotiation with the steel supplier.

\(t\) equals a radius equivalent to the steel thickness.

The suggested radii should be used as minimums for 90° bends in actual shop practice.
SUMMARY OF CHANGES

Committee A01 has identified the location of selected changes to this standard since the last issue (A606 – 09) that may impact the use of this standard. (Approved November 1, 2009.)

(1) Section 4.1.6.1 deleted.
(2) Reversed order of 4.1.9 and 4.1.10 and added new section 4.1.10.1.

Committee A01 has identified the location of selected changes to this standard since the last issue (A606 – 04) that may impact the use of this standard. (Approved April 1, 2009.)

(1) 1.2 replaced.
(2) Note 3—Metric example added.
(3) 7.1.2—Metric values changed from “soft” to “hard.”
(4) 9—Entire paragraph replaced with current wording on retesting, resampling, etc.
(5) Table 2—Metric values changed from “soft” to “hard.”
(6) Table 3—Metric values changed from “soft” to “hard.”
(7) Standard Designation changed to show dual standard.

ASTM International takes no position respecting the validity of any patent rights asserted in connection with any item mentioned in this standard. Users of this standard are expressly advised that determination of the validity of any such patent rights, and the risk of infringement of such rights, are entirely their own responsibility.

This standard is subject to revision at any time by the responsible technical committee and must be reviewed every five years and if not revised, either reapproved or withdrawn. Your comments are invited either for revision of this standard or for additional standards and should be addressed to ASTM International Headquarters. Your comments will receive careful consideration at a meeting of the responsible technical committee, which you may attend. If you feel that your comments have not received a fair hearing you should make your views known to the ASTM Committee on Standards, at the address shown below.
